

Abstract

A system for monitoring imports and exports includes a number of client computers (10), an enterprise server (12), a customs server (16) and a database (14). The client computers provide interfaces for users to input information and obtain information. The enterprise server audits import and export materials based on information on stocks, automatically generates a bill of entry, and transmits the bill of entry to the customs server. The enterprise server includes a system configuring module, a data maintaining module, a bill of entry generating module, a bill of entry status maintaining module, a customs data synchronizing module, and an auditing module. The database stores configured information, generated bills of entry, and feedback of the customs server. A related method is also disclosed.
